Model baseline entering Week 1

Strength indices are league-relative research measures, not ratings, probabilities, or predictions. Values are based only on information available through the selected week. This is not a game prediction, spread, or win-probability model.

Domain indices, ranks, and confidence are read directly from the model's existing outputs (data source: weekly_snapshot); this report performs no independent strength calculation. Nine domains, equal-weight means of shrunk z-scores -- see config/strength.yaml.
